Fiza Mohammad

fizamohammadd@gmail.com 80089 04309 Mohammad Fiza Hyderabad

OBJECTIVE

Aspiring Product Analyst with a strong foundation in SQL, Python, statistics, and data analysis, with hands on project experience in large scale data analysis, data quality, performance benchmarking, and data visualization. Skilled in translating data into actionable insights and reporting to support product optimization and data driven decision making.

SKILLS

Programming & Databases
Python, SQL, MySQL

Data Visualization & Reporting
Power BI, Excel, Matplotlib, Seaborn

Data Analysis
Exploratory Data Analysis (EDA), Statistics, Data Quality Checks

Libraries & Tools
Pandas, NumPy, MySQL Workbench, GitHub

PROJECTS

Airline Operations & Revenue Analysis 2026
Exploratory Data Analysis | Python | Pandas | Matplotlib
- Integrated 8 airline datasets, including 1M+ ticket flight records, using Python and Pandas to analyze flight operations, bookings, occupancy, fares, and revenue and built data visualizations to communicate findings from these large datasets.
- Performed EDA and statistical analysis across fares, routes, aircraft utilization, and booking patterns, benchmarking performance across aircraft types and routes to identify operational and revenue optimization opportunities.
- Analyzed ₹21B in ticket revenue and found average aircraft occupancy ranging from 43.0% to 65.9% across aircraft types, highlighting where utilization could be improved.

Patient Wait List Insights 2025
Power BI Dashboard
- Hospital teams lacked visibility into patient waiting lists, making it difficult to identify bottlenecks across specialties and case types.
- Built an interactive Power BI dashboard using Power Query for data cleaning (data quality) and DAX for KPI tracking, enabling dynamic filtering by specialty and case type.
- Improved reporting on wait-time patterns and benchmarked performance across specialties, demonstrating how targeted data visualization supports hospital planning and process optimization

AppVision 2025
SQL Analysis of Play Store Apps
- Play Store app data was unstructured and difficult to query efficiently, limiting insights into developer performance and market trends.
- Designed complex SQL queries using joins, CTEs, CASE logic, and window functions, while standardizing key column formats to improve data quality and streamline processing.
- Surfaced actionable insights on app categories, ratings, and developer activity, benchmarking performance across categories to support product optimization and market decisions.

EDUCATION

Rajiv Gandhi University of Knowledge Technologies, Basar 2019 – 2025
6-Year Integrated B.Tech in Computer Science and Engineering

CERTIFICATIONS

SQL 50 Badge
Leetcode

Tech for Her - Data Science Training
UWH & Wells Fargo
